Electric Resource Strategies

Current California legislation (SB 100) dictates that all utilities must have a Renewable Portfolio Standard of 60% by 2030, and requires all of the state's electricity to come from carbon-free resources by 2045. TDPUD is well-positioned today to meet the 60% target by 2030 while working to increase the percentage of its electricity that comes from carbon-free resources. A key TDPUD planning document is the recently adopted Integrated Resource Plan (IRP), which explores how best to match customer demand and regulatory mandates with clean, reliable, and affordable electric services.
